

**Use covering spot welding machines for effaced
machine details and improves machine details surfaces**
**K. Kasimov-supervisor teacher, N. Mirzaeva, M. Kabildjanov 2nd
year master AndMBI**

We use spot welding machines in 0.001-10 mm steel sheets and materials.
Nowadays spot welding machines performances are:

- take regular high quality joints;
- simple automatic;
- compact work condition;
- quickly welding process;
- economize electricity;
- economize water;
- economize air;
- economize time;

Since 1960 European engineer scientists interested covering spot welding machines. Because covering spot welding machines will use effacing surfaces of machine details. There are many machine details work with rubbing processes. And when this machine details surfaces be effaced, scientists thought use covering spot welding machines. Covering machine details surfaces are economize than to buy new machine details. Nowadays welding engineer scientists use covering spot welding machines by powder materials, steel belts and steel wires to covering effaced surfaces of machine details. These process performances are simple automatic, economies method, inexpensive and simple repairing machine details.

Rubbing process

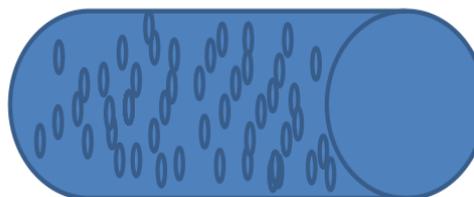

In welding process use powder composition materials are effective than use steel belts or steel wires. The powder composition materials structures are: nickel, titan, copper, iron, merganser, chrome and other metals. We know nickel, titan, chrome, merganser, and other metals use and improve machine details and save these machine details firmness, durability, corrosions.

The second method in covering spot welding is covering with steel belts in effaced surfaces machine details. This method use effacing surfaces of machine details degree is in 0.3-0.5mm. The third method is covering with steel wires.

Covering with steel belts

Covering machine details surfaces are economize than to buy new machine, economize time, air, water, energy, automatic and others.

Covering with powder materials
